SUPERMARKET SALES ANALYSIS

EXECUTIVE SUMMARY

Project Overview

This project analyses supermarket sales data from three branches located in Lagos, Abuja, and Port Harcourt. The dataset contains 1,000 transactions covering January to March.

The analysis aimed to understand sales performance, customer purchasing behaviour, product performance, and shopping patterns. The findings are intended to help supermarket management make better business decisions.

Key Findings

1. Branch Performance

Port Harcourt generated the highest total sales at approximately 39.8 million, while Lagos and Abuja each generated about 38.2 million. Branch C also recorded the highest gross income.

2. Monthly Sales Performance

January recorded the highest sales at approximately 41.9 million. March followed with 39.4 million, while February recorded the lowest sales at approximately 35 million.

3. Product Performance

Food and Beverages generated the highest revenue at approximately 20.2 million. However, Electronic Accessories recorded the highest quantity sold, showing that the product line selling the most items does not necessarily generate the highest revenue.

4. Customer Behaviour

Members generated approximately 59.1 million in total sales, compared with 57.1 million from normal customers.

5. Payment Methods

ePay was the most frequently used payment method, with 345 transactions. However, cash generated the highest total sales revenue.

6. Shopping Patterns

Weekdays generated more total sales than weekends. However, the average amount spent per transaction was higher during weekends.

Business Recommendations

Based on these findings, I recommend that management:

1. Maintain enough stock of popular products, especially Food and Beverages.
2. Encourage more customers to become members through loyalty rewards and special offers.
3. Investigate lower sales in February and introduce promotions during slower periods.
4. Improve staff scheduling during busy shopping hours.
5. Study the performance of the Port Harcourt branch to identify strategies that could benefit other branches.
6. Continue offering different payment methods to meet customer preferences.

Limitations

The dataset covers only three months, so the findings may not represent sales performance throughout the year.

Also, the dataset does not include complete operating expenses or detailed customer purchase histories, which limits deeper profitability and customer loyalty analysis.

Conclusion

The analysis shows that supermarket sales performance varies across branches, product categories, customer types, and shopping periods.

By using these findings, management can improve inventory planning, strengthen customer loyalty, manage staffing more effectively, and identify opportunities to increase sales.

Overall, the project demonstrates how data analysis can support better business decisions.
